

Technical Task

Please create the following application using ReactJS, NodeJS, and any database you want.

Create a health care application as follows:

- 1- Create user type = patient, where the patient can login and reserve a visit with a doctor
- 2- Create user type = Doctor, where the doctor can login and start patient visit, and fill medical information.
- 3- Create user type = Finance, where the finance can review the doctor noted, and the amount of the money that is required from the patient.

Notes:

- 1- Each doctor can have 1 visit at the same time
- 2- In each visit, the doctor will add multiple treatments, and the value of each one
- 3- Visit total amount should be calculated automatically.
- 4- Finance account can search for visits based on doctor name, patient name, or visit id. It also should be possible to search based in more than one variable at the same time

Optional points:

Create simple dashboard and show what ever needed information

Please add the code to git repository once you are done, and be ready to make a full demo.
